

SUMMARY

A cordless terminal for connecting to computer networks and communication and/or information networks, suitable for surfing the Internet and remote handling of e-mail, being comprised of a reduced sized terminal which comprises a motherboard and processor unit, with integrated controlling devices of the peripherals and large storage means for the operating system and user applications. Said terminal comprises of a viewing screen having limited thickness, for example, LCD-TFT type or similar, onto which there is a tactile panel for interaction with the user, being the mobile terminal connected a cordless connection preferably via radio electric or microwave signals, with a fixed support module and/or with remote servers. Said fixed support module has an electrical supply source joined to the electricity network and a modem or similar of telephone connection or cable to a remote server network. Said support is associated to the feeding supply with a charging of the batteries, suitable for the recharging of the terminal feeding batteries when said terminal is at a distance from the support.
